ISO WHITEPAPER

HOW TO USE ISO 14090 TO SUPPORT ISO 14001 AND ADAPTATION TO CLIMATE CHANGE

Acknowledgments

This paper was drafted in 2020 by an Ad-hoc Group chaired by John Dora of the UK,
with experts volunteering from ISO/ TC207/ SC1 and ISO/TC207/ SC7

Céline Phillips, Knut Jonassen, Fred Wenke, Thomas Rieger, Emilia G. Catto, Andrzej Ociepa, Franz Knecht, Lisa Greenwood, Brad Ridoutt, Willy Karlson, Richard Pagett, Andrea Mejia Martinez, Joachim Nibbe, Soojeong Myeung, Wiebke Meister, Nelson Lee, Christoph Töpfer and Lesley Wilson.

02

INTRODUCTION

The climate is changing, and this poses risks and opportunities for many organizations. Climate change is bringing different weather patterns, more extreme weather events, sea-level rise, flooding and storm surges. Changes in air quality, effects on employee health and safety, disruptions to operations and supply chains. These are but a few of the possible impacts of climate change, which are impacting all organizations to one degree or another and are of critical importance to many.

The Paris 2016 Climate Agreement and the 17 UN Sustainable Development Goals (SDGs) give added 'top down' impetus to organizations to understand better and address material environmental aspects, impacts and effects. Using ISO 14001 Environmental Management Systems and ISO 14090 *Adaptation to climate change* in combination can help.

ENVIRONMENTAL IMPACTS – MITIGATION AND ADAPTATION

Those already using ISO 14001 *Environmental management systems* will know about mitigating climate change, but now adaptation to climate change is recognised as a high priority. Climate change impacts seem to be accelerating and mitigation efforts will take decades to have a beneficial effect.

The 2015 revision of ISO 14001 talked about the need to consider how environmental conditions can affect the organization within an environmental management system. ISO 14090 now provides a framework for understanding and responding to - adapting to - the effects of climate change.

This ISO White Paper informs users of ISO 14001 about:

- The benefits of using ISO 14090 alongside ISO 14001;
- How ISO 14090 is structured; and
- Relevant clauses in both standards where ISO 14090 supports ISO 14001.

03**MITIGATION AND ADAPTATION**

Climate change mitigation relates to actions that limit the extent of climate change. This normally involves minimising or avoiding greenhouse gas and other emissions that contribute to climate change. It can also involve activities that remove carbon dioxide from the atmosphere.

Climate change adaptation is the related process of adjusting to the changing climate and its effects. Climate change adaptation can be incremental or transformational for organizations. Whatever the scope and scale, organizations will be more successful when climate change adaptation is well managed.

04

ISO 14090 AND ISO 14001

ISO 14090 is an international standard that provides organizations with a practical, structured approach for addressing and adapting to the impacts of climate change, with a focus on how climate impacts an organization. The organization in its adaptation process must also aim for sustainability and synergy with mitigation of climate change.

ISO 14001 has an emphasis on environmental performance and the impact that an organization can have on the environment. This standard also requires an organization to consider, and where necessary, take action to address identified risks and opportunities related to its context - including risks and opportunities associated with environmental conditions that can affect the organization. Thus, while an organization's starting point with ISO 14001 may be associated with its impact on the environment, the added value of ISO 14090 is its focus on the impact of climate change on an organization.

Climate is often described or projected over a long period of time, such as 30 years or more, and ISO 14090 provides emphasis on temporal elements of environmental management with regard to climate adaptation efforts.

05

This includes considering the timescale associated with the consequences of potential adaptation actions and evaluating adaptation options over the lifespan of these consequences, as well as identifying indicators to measure the evolution of climate impacts on the organization over time, and how the organization's capacity for adaptation evolves. For ISO 14001 users with climate-related risks and opportunities that need to be addressed, ISO 14090 offers extensive guidance on temporal considerations and management of climate-related change as the organization and environmental context evolve.

ISO 14090 can help an organization to enhance its understanding of climate risk and adaptation, as well as to understand and document the impact of its activities and related improvement measures, in support of the Paris Climate Agreement and the UN Sustainable Development Goals. Many of the requirements in ISO 14090 can be aligned with actions already being undertaken by organizations that use ISO 14001. It has been written in a way that should make it relatively easy for users of ISO 14001 to adopt. Many of the requirements in ISO 14090 can be fitted into actions already being undertaken by organizations that use ISO 14001.

WHERE DOES ISO 14090 SUPPORT ISO 14001?

The following table indicates how clauses in ISO 14001 can be supported by parts of ISO 14090, with direct reference to key clauses in each. Notes explain the rationale as to why.

06

ISO 14001	Supporting ISO 14090 clause(s)	ISO 14090 - Explanatory Notes
<p>4.1 Understanding the organization and its context Requires identification of internal and external issues that could affect the organization’s ability to meet intended outcomes of its environmental management system (EMS) - such issues may include climate or climate-related conditions that can affect the organization, or be affected by its activities.</p> <p>Note: this calls for identification from a “high-level” perspective, rather than a detailed assessment.</p>	<p>5 Pre-planning</p> <p>6. Assessing climate change impacts including opportunities</p>	<p>Pre-planning involves assessing the capability of the organization to undertake Clauses 6 to 10. The process is relevant when an organization initiates climate change adaptation, and when reassessing or revising its climate change adaptation.</p> <p>Climate change and the impacts of climate change are external issues relevant to the purpose of many organizations. Clause 6 requires an organization to assess how its activities, products and services might be affected by climate change, including slow onset (chronic) impacts as well as sudden (acute) impacts due to extreme events. This can also involve analysing influencing factors relevant to the organization’s context, such as internal and external policies; organizational strategies; and life cycles of policies, plans and assets.</p>
<p>4.2 Understanding the needs and expectations of interested parties Requires identification of stakeholder needs and expectations that are relevant to the organization’s EMS and determination of those it will comply with (including those with which it has to comply from a legal perspective). This can include climate or climate adaptation related needs, expectations and obligations.</p>	<p>5 Pre-planning</p> <p>6. Assessing climate change impacts including opportunities</p>	<p>Pre-planning involves identifying interested parties and how the organization engages with them. Clause 5 provides guidance on potential interested parties with regard to climate change adaptation, as well as benefits of their consultation and participation.</p> <p>Clause 6 requires a comprehensive, cross-cutting (systemic) assessment of climate change impacts on the organization. This can involve analysing various influencing factors, including climate adaptation actions taken by third parties.</p>

07

<p>4.3 Determining the scope of the environmental management system Requires defining the boundaries within which the EMS applies. For climate change, this could address spatial, temporal and other boundaries that reflect the scope of adaptation.</p>	<p>5 Pre-planning 7.4.2 Scope of the plan and boundaries of the system</p>	<p>Pre-planning can also be referred to as scoping, with regard to adaptation efforts and capabilities. It involves an assessment of the organization’s capabilities and context relative to climate adaptation, and could be helpful in defining management system boundaries with regard to adaptation activities. Subclause 7.4.2 also requires an organization to identify the boundaries of the organizational system being addressed.</p>
<p>4.4 Environmental management system This involves a general, overarching requirement to enhance environmental performance by establishing and improving upon an EMS, in accordance with requirements set out in the rest of the Standard. If an organization identifies climate-related risks or opportunities that need to be addressed, the EMS would need to be designed with this in mind.</p>	<p>6. Assessing climate change impacts including opportunities 7 Adaptation planning 8 Implementation 9 Monitoring and evaluation 10 Reporting and Communication</p>	<p>ISO 14090 offers guidance on assessing how an organization’s activities, products, and services, including investments and activities along the value chain, might be impacted by climate change, and on planning actions for climate adaptation, which can be incorporated into an EMS to mitigate climate-related risks for the organization and leverage opportunities</p>
<p>5 Leadership Specifies how an organization’s top management is expected to demonstrate leadership, commitment to, and accountability for the EMS (5.1), and to assign EMS roles and responsibilities within the organization (5.3). This includes roles and accountability for</p>	<p>5 Pre-planning 6.3 Assessing adaptive capacity 7 Adaptation planning 7.3 Decision-making 8.1 Leadership and commitment</p>	<p>Leadership and commitment are key components of the adaptive capacity of an organization. They are necessary at all stages from the pre-planning and planning stages to implementation, and transparency with stakeholders regarding performance outcomes. Subclause 8.1 specifies expectations for top management in demonstrating leadership of, commitment to, and accountability for implementing climate adaptation plans.</p>

<p>An organization must then plan actions to address these particular risks and opportunities (6.1.4), including setting environmental objectives and plans to achieve them, as well as identifying indicators for monitoring progress (6.2). This can include climate action objectives and plans.</p>		
<p>7 Support Includes a range of actions and processes that support the implementation of an effective EMS, including planned actions to address identified risks and opportunities or to achieve the environmental objectives, and provision of the necessary resources (7.1). Support actions include determining, and where necessary acquiring, the necessary competence among personnel in order to meet environmental performance objectives and requirements (7.2); ensuring awareness of the EMS and how work activities can affect the environment (7.3); establishing processes for internal and external communication relevant to the EMS (7.4); and control of documented information to ensure it is protected and available when needed (7.5). Support actions</p>	<p>5.0 Pre-planning 6.1 General 7.3.2 Identification of climate change adaptation actions 7.4 Adaptation Plan</p> <p>10 Reporting and communication</p>	<p>Pre-planning involves assessing, and where necessary establishing, the capability of the organization to undertake Clauses 6 to 10. This can tie in with establishing competency among personnel, in ISO 14001. Clause 7.4 provides guidance on climate change adaptation actions, which can be integrated to address climate-related risks and opportunities. This includes</p> <ul style="list-style-type: none"> • Soft measures linked to building adaptive capacity, for example, developing new knowledge, embedding climate change into the organization’s policies and operational procedures, training, and awareness raising. • Hard measures involve structural approaches, such as infrastructure and/or buildings designed for adaptation; as well as ecosystem-based adaptation, such as flood protection zones, and natural soil surfaces for rainwater management. <p>Clause 10 provides guidance on external communication and reporting on climate change adaptation. It may also support</p>

10

<p>can be applied in relation to climate action objectives, climate awareness, and communication, as appropriate.</p>		<p>answering the growing expectations of stakeholders in relation to documenting climate impact or risk reduction.</p>
<p>8 Operation Requires control of operations as needed to meet EMS requirements and implement actions to address identified risks and opportunities - including those related to climate change. This includes establishing operating criteria, implementing controls, and ensuring environmental requirements are communicated and addressed across the product life cycle stages, as appropriate.</p>	<p>7. Adaptation planning 8.2 Implementation plan 9 Monitoring and evaluation</p>	<p>Sub-clause 8.2 provides guidance on transforming the climate change adaptation plan into activities.</p>
<p>9 Performance Evaluation Requires monitoring and evaluation of environmental performance, and compliance with legal and other requirements, and the adequacy of EMS implementation, as well as management review of the system and changing circumstances - especially related to change in climate and adaptation to this change - in order to inform decisions on actions needed for improvement.</p>	<p>9 Monitoring and evaluation</p>	<p>Clause 9 offers guidance on using monitoring and evaluation to ensure that satisfactory progress on climate change adaptation is confirmed, and that indications of unsatisfactory progress are timely enough to enable the organization to take corrective action.</p>

11

10 Improvement

Requires taking action to address opportunities for continual improvement identified in performance evaluation, and to achieve EMS intended outcomes, including adapting to climate change.

Introduction

4.3 Flexibility

7 Adaptation planning

The approach of 14090 is iterative, supporting continual learning and improvement processes. The organization is required to adopt an adaptive management approach that enables the capture of new knowledge and learning from the experiences of decision-making to inform future decisions.
